Section 1 : Coding

1. Problem Statement

Aarav is working on a program to analyze his test scores, which are stored in a doubly linked list. He needs a solution to input scores into the list and determine the highest score.

Help him by providing code that lets users enter test scores into the doubly linked list and find the maximum score efficiently.

Input Format

The first line consists of an integer N, representing the number of elements to be initially inserted into the doubly linked list.

The second line consists of N space-separated integers, denoting the score to be inserted.

Output Format

The output prints an integer, representing the highest score present in the list.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 4
89 71 2 70
Output: 89

Answer

```
#include<stdio.h>
#include<stdlib.h>
struct node{
    int d;
    struct node*next;
    struct node*prev;
};
struct node*create(int d){
    struct node*nnode=(struct node*)malloc(sizeof(struct node));
    nnode->d=d;
    nnode->next=NULL;
    nnode->prev=NULL;
    return nnode;
}
void in(struct node**head,int d){
    struct node*nnode=create(d);
    if(*head==NULL){
        *head=nnode;
        return;
    }
    struct node*temp=*head;
    while(temp->next!=NULL){
        temp=temp->next;
    }
    temp->next=nnode;
    nnode->prev=temp;
}
```

```
int max(struct node*head){  
    if(head==NULL) return -1;  
    int ms=head->d;  
    struct node*temp=head;  
    while(temp!=NULL){  
        if(temp->d>ms){  
            ms=temp->d;  
        }  
        temp=temp->next;  
    }  
    return ms;  
}  
int main(){  
    int n,d;  
    struct node*head=NULL;  
    scanf("%d",&n);  
    for(int i=0;i<n;i++){  
        scanf("%d",&d);  
        in(&head,d);  
    }  
    printf("%d\n",max(head));  
}
```

Status : Correct

Marks : 10/10

2. Problem Statement

Sam is learning about two-way linked lists. He came across a problem where he had to populate a two-way linked list and print the original as well as the reverse order of the list. Assist him with a suitable program.

Input Format

The first line of input consists of an integer n, representing the number of elements in the list.

The second line consists of n space-separated integers, representing the elements.

Output Format

The first line displays the message: "List in original order:"

The second line displays the elements of the doubly linked list in the original order.

The third line displays the message: "List in reverse order:"

The fourth line displays the elements of the doubly linked list in reverse order.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5

1 2 3 4 5

Output: List in original order:

1 2 3 4 5

List in reverse order:

5 4 3 2 1

Answer

```
#include<stdio.h>
#include<stdlib.h>
typedef struct Node{
    int data;
    struct Node* prev;
    struct Node* next;
}Node;
Node* createNode(int data){
    Node* newNode=(Node*)malloc(sizeof(Node));
    newNode->data=data;
    newNode->prev=newNode->next=NULL;
    return newNode;
}
void insertEnd(Node** head,Node** tail,int data){
    Node* newNode=createNode(data);
    if(*head==NULL){
        *head=*tail=newNode;
    }else{
        (*tail)->next=newNode;
        newNode->prev=*tail;
    }
}
```

```

        *tail=newNode;
    }
}

void displayForward(Node* head){
    Node*temp=head;
    while(temp!=NULL){
        printf("%d",temp->data);
        if(temp->next!=NULL)printf(" ");
        temp=temp->next;
    }
    printf("\n");
}

void displayBackward(Node* tail){
    Node*temp=tail;
    while(temp!=NULL){
        printf("%d",temp->data);
        if(temp->prev!=NULL)printf(" ");
        temp=temp->prev;
    }
    printf("\n");
}

int main(){
    int n,value;
    Node*head=NULL;
    Node*tail=NULL;
    scanf("%d",&n);
    for(int i=0;i<n;i++){
        scanf("%d",&value);
        insertEnd(&head,&tail,value);
    }
    printf("List in original order:\n");
    displayForward(head);
    printf("List in reverse order:\n");
    displayBackward(tail);
    return 0;
}

```

Status : Correct

Marks : 10/10

3. Problem Statement

Krishna needs to create a doubly linked list to store and display a sequence of integers. Your task is to help write a program to read a list of integers from input, store them in a doubly linked list, and then display the list.

Input Format

The first line of input consists of an integer n , representing the number of integers in the list.

The second line of input consists of n space-separated integers.

Output Format

The output prints a single line displaying the integers in the order they were added to the doubly linked list, separated by spaces.

If nothing is added (i.e., the list is empty), it will display "List is empty".

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 5

1 2 3 4 5

Output: 1 2 3 4 5

Answer

```
#include<stdio.h>
#include<stdlib.h>
struct node{
    int data;
    struct node*prev;
    struct node*next;
};
struct node*create(int data){
    struct node*nnode=(struct node*)malloc(sizeof(node));
    nnode->data=data;
    nnode->next=NULL;
    nnode->prev=NULL;
```

```
    return nnode;
}
void ins(struct node**head,int data){
    struct node*nnode=create(data);
    if(*head==NULL){
        *head=nnode;
        return;
    }
    struct node*temp=*head;
    while(temp->next!=NULL){
        temp=temp->next;
    }
    temp->next=nnode;
    nnode->prev=temp;
}
void dis(struct node*head){
    if(head==NULL){
        printf("List is empty\n");
        return;
    }
    struct node*temp=head;
    while(temp!=NULL){
        printf("%d",temp->data);
        temp=temp->next;
    }
    printf("\n");
}
int main(){
    int n,data;
    struct node*head=NULL;
    scanf("%d",&n);
    if(n==0){
        printf("List is empty\n");
        return 0;
    }
    for(int i=0;i<n;i++){
        scanf("%d",&data);
        ins(&head,data);
    }
    dis(head);
}
```
